Introduction

How To Use

This document contains 50 aircraft (and 8 NPC aircraft) for use in *Flying Circus*, with profiles, lore, and links to the Aircraft Builder. With it, you can easily play a full campaign with a large variety of unique aircraft, each with their own strengths and weaknesses, history, origin, and role.

When you select an aircraft, fill out your Instrument Panel and Component Cards with the statistics listed. Alternately, you can load the aircraft into the plane builder by clicking the link or loading the aircraft's file, and clicking "Save Dashboard" at the top. This will automatically create filled out sheets you can print and use with your aircraft.

Aircraft Designations

The aircraft contained within are a mix of historically-inspired designs which correspond to real aircraft and fantasy machines unlike anything that ever flew. Early aviation history is filled with bizarre machines: that's what makes it fascinating!

In early aviation parlance, a 'fighter' is specifically an armed two-seat aircraft designed to fight other planes, while a 'scout' is a single-seat aircraft, armed or not. Scout is used for single-seat combat planes throughout this document for authenticity.

Aircraft Engineering

You can play the game without modifying anything about any of the aircraft all, but the builder also makes modifying planes easy and quick, once you understand the principles. It might be intimidating at first blush, but with a bit of experimenting you can make aeroplanes in minutes.

The Variations

It is easiest to learn to use the builder by making one of the variations offered for the aircraft in this book. Bring up its profile in the builder and then make just the modifications you need to change.

For instance, we can convert the Ritter Model F ‘Singvogel’ to its Model E configuration with just a few simple changes. First, scroll down to the “Tail” section, below “Frames and Covering” and above “Wings”. There, you can adjust the length of the aircraft’s tail. You can click the ‘Rules’ section here to see the math that will happen when you do, but you can also just experiment to find out what it does.

Click the drop-down menu and change the tail length from “Stubby” to Standard”. Then, scroll down to the “Weapons” section. The Singvogel has 1 Mount of 2 standard Machine-Guns, but the Model E we’re modifying it to loses one of those guns. All you have to do is change the number in the “Weapons at Mount” field to 1.

Now, when you scroll to the bottom of the sheet, we have a new aircraft. It carries fewer weapons, and the new longer tail has raised its Stability while lowering its Handling. The new aircraft is much safer now, and might be more suited for characters with low Calm.

New Aircraft

Once you’ve made a few variations, you can take a crack at making your own aeroplane. Start by replicating a real life aircraft: go to the Wikipedia page for the Fokker DR.I, for example. Then, go through piece by piece: it has one cockpit, so add it. If you can’t find the historical engine, pick something that seems similar.

Be sure to read up carefully how the plane goes together. The Fokker DR.I is unusual for its era because it is built of steel spars, not wood. Add its weapons, use the Wing Area and Span stats that most aircraft have listed to add the wings, and put the supports in. A careful reading will reveal the aircraft has cantilever supports to hold the wings together.

The builder will require some trial and error to get used to, and there are times where it won’t cover every edge case and you’ll have to improvise or make judgement calls. Be advised that, for gameplay purposes, it deliberately produces planes 10-20% slower than real life, so don’t worry if your aircraft are coming out slower than you expect!

But with a bit of experimentation, you’ll be making awesome planes in no time. Make sure you get GM approval before springing a plane into a game, though: the builder is designed to make accurate planes more than balanced ones, so play fair!

Paint Schemes

If you want to decorate your plane all pretty-like, it might be helpful to have some ideas of how a plane might be decorated in-universe.

Farmer Planes

- The plane is a patchwork of mostly unpainted canvas, decades of repairs stitched into the skin in different colours and wears of fabric.
- The plane has been enthusiastically but crudely painted in emulation of a Great War ace. The colours are off and the lines aren't straight, but it's a labour of love.
- The plane has been painted a bold, solid colour, like barn red or fence white. It's attention-grabbing, but also probably the only paint the pilot had access to.

Soldier Planes

- The plane is simply an adaptation of a prewar paint scheme of a wartime power, perhaps with the roundels changed. The names of generations of previous pilots are written with great care on the side.
- The plane has a regional camouflage pattern that gives you an idea where the character is from, like snowy white-grey stippling or green and brown tiger stripes.
- The plane is lovingly maintained in expensive dyed lozenge-pattern camo or a complex dazzle scheme that hurts to look at.

Fisher Planes

- The plane has been left in grey-blue primer, old roundels painted over, and was clearly neglected by a community with better things to do.
- The plane is covered in interlocking patterns of runes and symbols, not unlike a fisher's tattoos. At night, these symbols glow faintly, and looking at them makes your eyes water.
- The plane seems plain and unadorned to onlookers, painted a simple, desaturated colour. To the eyes of its fisher pilots, it dances with patterns in ultraviolet paint.

Skyborn Planes

- The plane has elaborately dyed fabric wings with complex interlocking patterns, in bold colours like pink, turquoise, and gold.
- The plane has a highly polished stained wood surface, the grain highlighted.
- The plane has the paint scheme of a former imperial power, buried under hand-painted murals and patterns that have spread across its surfaces.

Believer Planes

- The plane has a carefully designed military paint scheme, with registration numbers for division, squadron, and the individual plane. It was one of eight.
- The plane is covered, front to back, in inspirational or devotional quotes and phrases.
- The plane is painted all over to resemble a flag, such as a republican tricolour.

Scion Planes

- The plane is unpainted, just gleaming polished steel and moulded plywood showing the expensive materials in its creation.
- The plane has clearly been painted by a classically trained artist, with murals depicting religious and historical scenes in great detail.
- The plane is rendered to resemble the familiar heraldry, with the same colours, patterns, and imagery.

Student Planes

- The plane was once a militia aircraft, with two bold colours and a jersey number. The pilot's name is inscribed in large, stencilled letters on the side.
- The plane was somebody's art project, with a swirl of abstract shapes and colours in cubist or modern avant-garde style. It clearly has a meaning nobody will understand.
- The plane has an advanced, scientifically-designed pattern of camouflage which is much more sophisticated than available elsewhere, such as real-life flecktarn, strichtarn, or splittertarnmuster patterns.

Survivor Planes

- The plane is unpainted and unadorned. No thought has gone into its aesthetics at all, just primer and rustproofing.
- The plane once carried national colours, but the gas has bleached it out almost entirely, leaving it a ghostly green, mustard, or bone white.
- The plane has been painted with crude murals displaying its pilot's imaginings of the outside world, resembling the fanciful and enthusiastic paintings of a child.

Worker Planes

- The plane has been painted in flashy stripes and checkerboards in strongly contrasting white, black, and primary colours to grab attention.
- The plane bears the livery of a different pilot altogether, with somebody else's name, noseart, and kill indicators. A stain in the cockpit indicates how it ended up in the hands of a novice pilot looking for a good deal on a used plane.
- The plane has suffered the attentions of the pilot's children, with haphazard colours, fingerpainted scenes, and bright handprints on everything in reach.

Witch Planes

- The plane is painted with a green and brown pattern designed to make it easy to hide in the woods. Its underside is a sky blue or grey.
- The plane was reprimed and then carefully painted with intricate knotwork covering it back to front, perhaps in bright green or blue.
- The plane appears to be painted in a disruptive pattern, but close inspection reveals that what you thought was plywood is bark, that canvas is in fact overlapping leaves, and the metal is weathering unnaturally and beautifully.

Early Aircraft Anatomy

How exactly early aeroplanes work is fascinating in and of itself, and knowing can help you describe your aircraft in the narrative and make your game more engaging!

Engines

The vast majority of aircraft in Flying Circus are powered by internal combustion engines, like in a car, with pistons in cylinders connected to a crankshaft, burning fuel for power. Engines are distinguished primarily by how they are kept from overheating. Engines can be roughly divided into air-cooled and liquid-cooled variations. Both are used on aircraft, and both have their own strengths and weaknesses.

Air-cooled engines use the passage of air over the cylinders to keep from overheating. They are often arranged as radial engines, with the cylinders laid out in a circle. These engines have the advantage of not needing heavy cooling systems, but the primary downside is that the engine being exposed to the airflow means the engine causes a lot of drag. In the era Flying Circus is set in, there is also the problem that the air just isn't sufficient to cool these sorts of engines running at maximum power.

The clever solution to this is called a rotary engine. These are radial engines mounted backwards, causing them to spin while the crankshaft remains static. The propeller is then simply bolted to the engine. The spinning exposes the engine to more air, making it easier to cool, and this allowed for very light engines with very high power.

Rotary engines do have disadvantages. The biggest is that the engine cannot have conventional oil lubrication, because oil has to be able to move around the engine to stay cool. So instead, it is a total oil loss system, with the oil mixed directly in with the fuel. This requires a kind of oil that will still work when mixed: castor oil. As the engines tended to leak oil very badly, and castor oil can cause diarrhoea...

The other disadvantage is that rotary engines waste a great deal of their power moving the heavy engine around, which decreases their effective output. Additionally, a hundred and fifty kilograms of whirling steel has a gyroscopic effect on aircraft, which does odd things to their handling and tends to make these planes very unstable. It can be exploited for fast turns, but it's dangerous.

By contrast, liquid-cooled engines put a jacket of water (or other coolant) around the cylinder, and run them through pipes to a radiator. Liquid-cooled engines don't need to expose their cylinders to airflow, so they are often arranged in one (inline) or two (V) rows. This is more mechanically efficient and allows the use of superior valvetrains for more power, but liquid engines are heavier and have radiators which add extra drag and are quite vulnerable to damage.

Wings

Most aircraft in this era are biplanes: they have two decks of wings, stacked one atop the other. This configuration has several advantages.

- It allows a greater amount of wing area for lift with smaller, easier to support wings.
- It works well with tension support to create strong frames (see next section).
- It allows high aspect ratios (wings are more efficient when they are long and thin) but shorter wingspans (the shorter a plane's wingspan, the faster it can roll.)

However, biplanes are not without disadvantages as well. Most notably, biplanes have higher drag (because they have more exposed forward surface area) and less efficient lift (because wings close together cause 'shadowing' in the airflow). Thus, biplanes are slower than a monoplane with the same design and equal wing area.

Triplanes, and planes with more wings, allow for an exaggeration of the strengths of the biplane, but also exacerbate the downsides. They were useful only in niche applications.

Struts, Spars, & Piano Wire

Because of the need to stay very light, aircraft cannot be built the way a building might be. They need to support their weight, and resist the forces of flying, without being able to be built of solid materials.

Thus, early aeroplanes were made as tension structures from a mix of spars and wires. The spars, rigid poles of wood or metal in and between the wings, hold the parts of the plane apart, while the wires, strung in between the spars, pull them together. The same principle is used in suspension bridges.

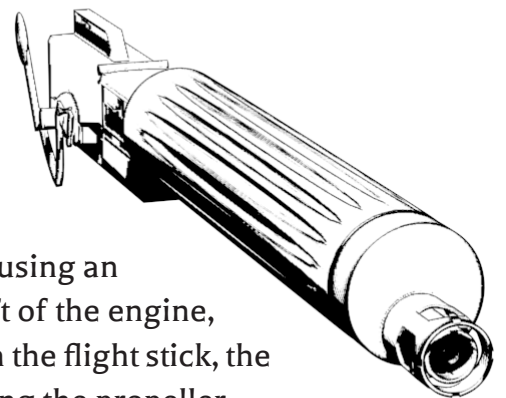

However, in 1915, aeroplane designer Hugo Junkers invented the cantilever spar, a single solid piece mounted through the wing and braced to resist strain. Not only did this eliminate the drag of the struts and wires, but it accidentally made the wing thicker than usual. They didn't know it yet, but thicker wings are actually much more efficient.

Weapons

The majority of aircraft of this era used machine-guns firing rifle ammunition. Typically, they carried one or two, with five hundred rounds of ammunition each in cloth belts. Few planes carried more guns than that.

These weapons could fire through the arc of the propeller using an interrupter gear. This consisted of a cam on the crankshaft of the engine, connected to a trigger. When the pilot pulled the trigger on the flight stick, the rotation of the cam would fire the gun, timed to avoid hitting the propeller.

These weapons would be supplemented by open-bolt light machine-guns, which were often preferred for being more reliable. Open-bolt action meant they fired too inconsistently for interrupter gears, so they would be mounted on the wings or turrets.

Aircraft Companies of Himmilgard

At one time, Himmilgard was home to hundreds of aircraft design organizations, ranging from cottage industry to massive nationalized corporations.

Arntwerke

Kaiserlandung, Gotha Plateau

Founded by the Brothers Arnt in 1573 to build knock-offs of the popular aircraft of the day, the machines of Klaus, Rudi, and Holger Arnt soon became common worldwide. After the war broke out, they made history for inventing the interrupter gear, but the breakup of their design team ended their creative streak. They still exist, unfortunately, as a nationalized arm of the Goth Armies.

Arntwerke

Braun Kitflugzeuge

Free City of Lomende, Daimler Coast

Prewar, the Braun company filled a niche of offering aircraft components at the cheapest rate possible, which allowed smaller nations, municipalities, and private clients to purchase planes for utility and military work. They continued to sell technically impressive, if not particularly innovative, designs to all parties of the Great War until Lomende was destroyed by a self-propagating incendiary in 1600.

Braun
Kitflugzeuge

Hugo Bennhold

Unknown

The personal corporation of eccentric aircraft designer Hugo Bennhold, little is known about the man or his company, or if he survived the war. It is known that Bennhold designed a variety of revolutionary all-metal aircraft and invented the cantilever spar, but his machines found few buyers and exist today mostly as knock-offs or surviving trial submissions.

Kreuzer Flugzeugwerke

Kaiserlandung, Gotha Plateau

Founded as a crown corporation of the Gotha Empire to bring together several promising designers, Kreuzer was the cutting edge of the Empire's war technologies. However, they had no engine production of their own, and Theler jealously hoarded the best engines, leaving Kreuzer to make excellent aeroplanes with subpar power plants.

König-Werke

Kohlingen, Voisin Valley

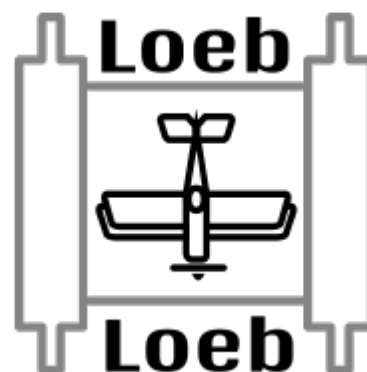

Founded by order of the late monarch King Albert, K-W was the primary manufacturer of aircraft for the Fokker Kingdoms throughout the war, building solid, reliable machines. Being very near to the Dark Sea, they were also the world's premier manufacturer of seaplanes, and had a large canal dug in the city for test flights. The company was gas bombed in 1600 and ceased to exist in any meaningful fashion.

Loeb & Loeb

Körtes, Lohner Forest

A cooperative founded by two brothers, Loeb & Loeb was born in the short-lived East Lohner People's Republic and swiftly annexed into the UWF before the official start of the war. L&L built a series of promising designs, but with the defeat of the UWF by the Gotha Empire, the brothers refused to create any more aircraft, fleeing to Loring and eventually disappearing from records. Their assets were absorbed by Theler.

Markgraf Schwerindustrie

Carpadem, Island of Sopwith

Markgraf Schwerindustrie began life as a company making wire trolleys for the Sopwith government. It was quickly pressed into service to make aircraft for the war effort, and produced a number of excellent machines in conjunction with the Royal Design Bureau. After the war, it has for the most part reverted back to public transport vehicles.

Rathenau

Seraeus, Macchi Peninsula

Among the largest aircraft companies at the beginning of the war, Rathenau was a multinational not unlike Arntwerke or Theler, but unlike those two it closed down its factories in the Gotha Empire and Fokker Kingdom at the beginning of the war, manufacturing and selling to the UWF and Macchi Republic. This principled stand didn't save them from eventual collapse after the arrest of Sebastian Rathenau for attempting to bribe Macchi government officials, leading to the company being acquired by Ritter Flugzeugwerke.

Recht AG

Levamasse, Dorand Lowlands

An agricultural and medical company, Recht began their aircraft production division to create utility aircraft for farming communities. Their line of sky tractors was among the most popular planes in the world at the outbreak of the war, and such was their importance to agriculture that the UWF was slow to shift them to a war footing. The company still exists today in much reduced form, now primarily producing medicine, fertilizer, and pesticide.

Ritter Flugzeugwerke

Westbeke, Schuckert Highlands

Founded around the designs of Astrid Ritter and initially operating out of a small rented hanger, Ritter Flugzeugwerke would survive the collapse of the UWF government, an emergency evacuation to Macchi, and eventually grow to one of the world's largest corporations through a mixture of successful designs, desperate governments, widespread strikebreaking, and hostile takeovers of at least three rivals.

Saft & Altmann Motorbau

Free City of Eisenfluss, Daimler Coast

Originally a company producing generators, SAM pivoted to aviation engines, building some of the best V8 engines on the market and selling them widely. As the wartime push for local production shrunk their client base, they began to produce aircraft as well. While the company no longer exists, much of their tooling has been recovered.

Teicher Flugzeugfabriken

Mitterben, Dornier Delta

In the early history of heavier than air flight, it was generally easier to build heavy aircraft as flying boats, and Teicher specialized in doing so. This experience allowed them to design the world's first practical bombers for the UWF, but their factories were quickly seized by the Fokker Kingdoms and they were reverted to seaplane production.

Theler Körperschaft

Salzkirch, Gotha Plateau

An enormous multi-industry, multinational corporation, and one of the oldest in the world, the Theler Corporation ended up producing aircraft for not just the Gotha Empire in which they were based, and their allies, but for other nations as 'independent subsidiaries'. They pioneered the use of steam moulded plywood as an aircraft material and initially built very good machines, but over time the quality slipped due to a focus on mass production. Undeterred, Theler simply bought up enough of the government to ensure they would never lose contracts.

Mitscher Industrie Gesellschaft

Blackburn, Westsee

Originally a tool and die company, Mitscher Industrial Company (commonly known as MIG) produced artillery, airships, rifles, aircraft, and armoured sky-trains for the UWF. Their aircraft division was untested and poorly staffed, considered less important than their airship yards, and they often had to sell production licenses to Ritter to fulfil government orders. Ritter eventually acquired the division outright, and MIG was broken up when the UWF fell.

von Morgen Flugzeuge

Fürstenberg, Fokker Mountains

Beginning as a manufacturer of transport aircraft during the war, Raphael von Morgen's company had a keen eye for both talent and good ideas, and soon began experimenting with high quality combat aircraft. These new designs were revolutionary, bringing together lessons from across the war into sleek and deadly machines, but very few of them made it into service before the war ended. There are rumours that Raphael von Morgen is still alive and that the company lives on, hidden somewhere in the Fokker Mountains.

Role	Scout
Served With	Gotha Empire, Fokker
First Flight	1595
Strengths	Heavily Armed
Weaknesses	Overweight, Unreliable
Inspiration	Albatros D.V (1917)

Theler Kobra MD

37p New, 18p Used

“Last of the Gotha V-Strutters”

1p Upkeep

	Boost	Handling	Climb	Stall	Speed
Full Fuel	3	96	5	6	18
Half Fuel	3	96	5	5	18
Empty	-	97	-	5	0

Vital parts

Engine, Radiator, Oil Cooler, MGs, LMG, Controls, Fuel, Landing Gear
Pilot

Dropoff 10, Reliability -3, Overspeed 24, Ideal Alt. 0-29, Fuel 6
Visibility -2, Stability +2, Energy Loss 4, Turn Bleed I
Toughness 10, Max Strain 22, Escape +2, Crash -1, Stress I
x2 Forward Accessible MGs ✂, x1 Flexible Forward/Up Accessible Wing LMG Collimated Gunsight (+1 Attack), High Offset Water Radiator

The Kobra was obsolete by the end of the war, but so much of Gotha’s infrastructure was built around them that replacing it entirely wasn’t seen as feasible. Theler’s outsized influence meant that even though the Empire had finally secured the castor oil, the new Kobra mark entered service.

The Kobra MD’s overcompressed Bertha FI466 powerplant required manual benzene injections just to start, and had a tendency to blow their cylinders through the valvetrain if you flooded the carburettor. Furthermore, the prototype still suffered wing twisting issues, an embarrassment when most Kreuzer designs were using cantilevers.

It’s generally believed that the Theler corporation essentially executed a coup of the Gotha Empire in order to preserve their order.

Common Variations

- MD Prototype: Remove Wire Root.
- Stripped Down: Field mod for drag Reduction. Remove overwing machine gun.
- von Morgen Kobra M(D): Licensed by Fokker. Add +Streamlining, +Redundancy, --Mass.
- MDc: Bomber interception variation. Remove MGs, add +2 overwing LMG.

Kreuzer Spinne M3

32b New, 16b Used

“Triplane Terror of the Northern Front”

1b Upkeep

	Boost	Handling	Climb	Stall	Speed
Full Fuel	2	108	5	6	15
Half Fuel	2	108	5	5	15
Empty	-	109	-	5	0

Vital parts

Engine, Oil Tank, Guns, Controls, Fuel, Landing Gear Pilot

Dropoff 9, Reliability -2, Overspeed 20, Ideal Alt. 0-29, Fuel 7
Visibility -3, Stability -4, Energy Loss 4, Turn Bleed 1
Toughness 16, Max Strain 21, Escape +2, Crash -1, Stress 3
x2 Fixed Forward Accessible MGs ✂, Rotary Engine (+1 to Dogfight when turning Right)

Lacking rotary fighters put the Gotha Empire at a distinct disadvantage going into the war in Macchi. The Macchi Singvogels were massively more agile than the Kobra MCs. Eventually, Gotha had to bite the bullet, despite the lack of available castor oil.

The M3 was limited to a mere 110hp engine, so it was made lean and mean: metal framed, closed cowl, and with triple wings for maximum lift. Its secret weapon was birch cantilever spars instead of tension wires for greatly reduced drag. The M3 served many of Gotha’s best aces in large ‘Wolf Pack’ squadrons in the second half of the war, making them quite sought after by post-war pilots.

Despite their excellent characteristics, the M3’s reliance on synthetic lubrication gave them chronic overheating problems in the northern heat, causing an early retirement from service which preserved a great many machines.

Common Variations

- MI: Remove 1-Strut. +2 birch reinforcements, +Mass -Redundancy.
- Upengined: Replace engine with Schreiber B.IX looted from downed enemy Singvogels.
- Late Prototype: Add an IAF 2 Supercharger to the engine, replaces MGs with BMGs.
- Parasite: Replace Landing Gear with Zeppelin Hook and Landing Skid.

Ritter Model F 'Singvogel'

28p New, 14p Used

"Defender of the Doomed Republics"

1p Upkeep

	Boost	Handling	Climb	Stall	Speed
Full Load	2	99	4	8	15
½, Bombs	2	100	5	6	15
Full Fuel	2	100	5	7	16
Half Fuel	2	100	5	6	16
Empty	-	101	-	5	0

Vital parts
Engine, Oil Tank, Guns, Controls, Fuel, Landing Gear, Electrics
Pilot

Dropoff 9, Reliability 0, Overspeed 19, Ideal Alt. 0-29, Fuel 7
Visibility -1, Stability -6, Energy Loss 4, Turn Bleed 1
Toughness 7, Max Strain 24, Escape +2, Crash -1, Stress 3
x2 Fixed Forward Accessible MGs ✂, Collimated Gunsight (+1 Attack), Oxygen Mask Rotary Engine (+1 to Dogfight when turning Right), 2 Mass Bombs, Windmill (0-1 Charge)

The most famous Ritter design, the Model F Singvogel was designed around high-powered engines that were becoming available as the Macchi Republic began to support the war effort in the UWF. Originally very similar to a Model C, it was upgunned and made more dangerous following a bombing raid on the Ritter factories.

The Model F's effectiveness comes from aggressively clustering all the machine's weight in a small forward area and moving the wings up to match. Thus, the machine can make incredibly aggressive turns, but is so unstable that it will slip into a complex spin with little provocation.

The Model F continued to be produced in Macchi even as the UWF fell. Even now it is a common sight in the hands of professional militias who can handle the training time and afford the losses that come with training new Singvogel pilots.

Common Variations

- Model E: Standard tail, remove 1 MG.
- F4: Upengined to W.O.I 150hp.
- Nachtvogel: Replaces MGs with x2 LMG on wing fore/up mounts, removes Wing Cutout.
- Panzervogel: 2/5+ Armour, x1 Mechanical MG.
- SeeVogel: Adds Floats, replaces MGs with BMGs

Pilot, Gunner

Dropoff 10, Reliability 0, Overspeed 28, Ideal Alt. 0-29, Fuel 7
Visibility -1/0, Stability +1, Energy Loss 7, Turn Bleed 1
Toughness 10, Max Strain 26, Escape +2/+2, Crash -1, Stress 1/0
Pilot: x1 Fore Accessible MG ✂, Collimated Gunsight (+1 Attack), Negate 1 Injury on Go Down Gunner: x2 Rear/Left/Right/Up Access Turret LMGs Inline Radiator, 8 Mass Bombs

The Markgraf Zerstörer was designed as a unique multirole aircraft, to fit the divergent doctrine of the Königliche Sopwith Fliegerkorps. Neither fully an observer, a bomber, or a fighter, these aircraft were truly flexible, expected to operate without escorts after *Attentäter* scouts secured the skies.

At the core of this remarkable aircraft was a V12 engine, which gave the aircraft speed competitive with single-seaters despite its bulk. It was also given a highly modular armament, capable of carrying a large number of bombs and a variety of weapons for both the pilot and gunner position to fill any role. It could even mount cameras!

Many nations tried to copy the machine with varied results, and post-War, the Sopwith government sold off much of their reserve stock. This makes the Zerstörer a common sight in the skies.

Common Variations

- C-series: Wollsteinkraft Verteidiger H engine, replace microtank with full tank.
- Pilot Weapons: Twin LMGs on upper wing deck.
- Gunner: x2 LMGs, x1 LRC or Punt Gun.
- Gotha Copy: Plywood Monocoque Body, Bertha F4398 490hp, Hi. Power prop, add 2 fuel tanks.
- Free Cities Copy: Steel frame, Aluminium skin and wings. Radio Transceiver and Alternator.

Theiler Drachen

6b New, 3b Used

“First in Service”

0b Upkeep

	Boost	Handling	Climb	Stall	Speed
Full Fuel	2	9I	3	2	10
Half Fuel	2	9I	3	2	10
Empty	-	9I	-	2	0

Vital parts

Engine, Radiator, Oil Cooler, Landing Gear, Controls, Fuel Pilot, Passenger

Dropoff 4, Reliability 0, Overspeed 2I, Altitude 0-29, Fuel 7

Visibility 0/0, Stability +I, Energy Loss 4, Turn Bleed 1

Toughness 6, Max Strain 30, Escape +2/+2, Crash 0, Stress I/0

Wing Warping (+I to Dogfight! when below 15 Speed)

Invented before the start of the Great War, the Theler Drachen was possibly the first plane to be built with a military role in mind. The Gotha Army made their first use of heavier-than-air observers in their border skirmishes in Lohner, using civilian two-seat aircraft to fly over the battlefield. The Theler Drachen was commissioned as a standard aircraft for this role.

Soon, the Drachen was one of the most common aircraft in the world, purchased by every nation and a great number of civilians. It was relatively easy to fly, easily modified, and cheap. Most pilots have their first training flight in a Drachen.

Though used in the first few years of the war for a variety of roles, they were soon withdrawn from any kind of combat service and redistributed as trainers, where most of them remain.

Common Variations

- Fokker Drachen: Steel tube frame.
- Late Gotha Drachen: Moulded wood monocoque.
- Macchi Geisterdrache: Celluloid wings.
- Homemade: Paper wings and skin.
- Civilian Drachen: Naked frame.
- Combat Drachen: Post-war: remove second seat, add xI MMG forward with interrupter gear.

Tree sculpting is among Himmilgard’s ancient arts, one of the few that predates flight. The process involves a mixture of careful pruning, guidance structures, and sometimes magic, often over the course of generations, to create elaborate groves that have life beyond the soil.

This art has been used to make airships over the centuries, but some isolated forest communities turned it towards creating aeroplanes during the Great War, to fight off the encroaching imperialist forces. Often, they would use engines, weapons, and components from downed war machines, but the frame would be living wood.

These examples are common in Lohner, likely based on UWF Sperlings and powered by engines taken from downed Gotha Kobras. The patterns carved into them are supposed to grant magical protection and guidance.

These planes need to be tended to carefully, and differently from most. Parking them on damp grass in the sun for at least a few hours every day is highly recommended.

Common Variations

- Salvaged Singvogel: Engine to Schreiber B.IX.
- Salvaged Panzer: Engine to N.M. Arbeiter.

Though there are many historians who dispute it, the Rathenau-7a is the first combat scout, as defined as a single-seat plane with fixed forward weapons designed to attack other aircraft. It achieved this by mounting deflector plates on the propeller of an unarmed Rathenau-7 observer. It was soon outclassed by Gotha's Arntwerke c.10.

The design of the engine mount, using a looped wire cage, made retrofitting an interrupter gear impractical. Before large scale revisions could correct this issue, the much better Rathenau-9 came into operation, using overwing guns and later interrupter gears themselves.

The largest operators of the Rathenau-7 were the various principalities of Lohner fighting alongside the UWF, and many of them remain in the hands of militias, usually upgraded to Schreiber B.IX engines from downed Singvogels.

Common Variations

- 7a: Rhona Motorbau ZII engine.
- 7b: 7a with flap ailerons instead of warping.
- 7c: 7b with an interrupter gear and MMG.
- EH.I: Fokker 'Einlochdecker' copy, refitted w/ Scholz Luchs X, interrupter, & MMG.

Radio Transceiver, Windmill (0-2 Charge), Battery (5 Charges)

In the years leading up to the Great War, and in countries that were not belligerents at various times, there was a roaring trade in ‘kit planes’, aircraft designed to be assembled by the purchaser. Oftentimes, a kit would consist of little more than the engine, steel parts, and instructions.

Powered by a pair of small, air-cooled V8 engines, and unusually quiet while running, the Braun Model VJ was a very popular kit plane known for its high speed and simple assembly. Military units began to purchase them as irregular observers, often out of pocket by commanders, owing to the fact they would outrun any early-war aircraft.

The most notable feature of the Model VJ, other than its blistering speed and lack of ailerons, is the ability to carry a lightweight radio, controlled by a passenger. This feature was rare originally, but became standard as the military used it more frequently.

Common Variations

- Desert: Convert engines to liquid-cooled, add twin inline panel radiators.
- Racer: Delete passenger & radio, add standard tail.
- Spy: Replace radio with observation camera.

The Fokker Kingdoms, ruling as it did over the Voisin Valley and Dornier Delta, was home to the largest population of Fischervolk in the pre-War world. Before the war, this rule was distant, but the pressures of industrial conflict soon changed that.

Though the Dark Sea itself is dangerous, fischers have a long tradition of creating artificial lagoons and tide pools for swimming and sea planes. Thus, the KW-SI was produced specifically for Fokker's campaigns, with the idea that a number could be sent as 'gifts' to fischer villages as trainers, before conscripting these new pilots to operate off the many lakes of the Dorand Lowlands.

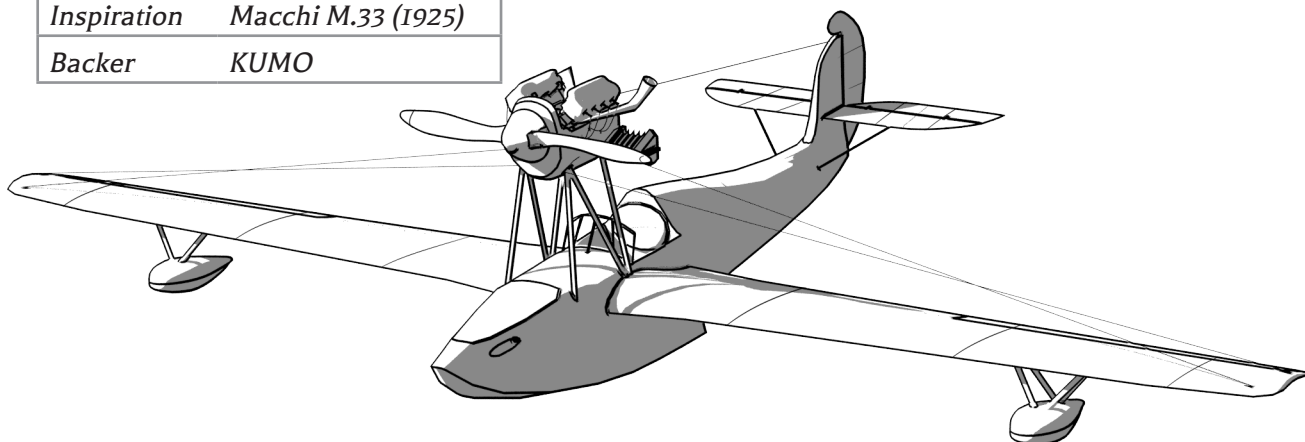

Produced in massive numbers, the SI remained in service past its obsolescence: ethnic fischer units were considered second rate, with later S-series planes passed up in favour of less expensive modifications to the SI, such as giving them used Kurier XVI engines from upgrading KW-ANs. There are towns in former Fokker territories where the SI is still being manufactured, using whatever engines and materials are available.

Common Variations

- SI-1: Guns moved inside the hull and covered.
- SI-5: Engine to Brandt Kurier XVI 180hp.
- ST: SI with a co-pilot position.

Though frequently sidelined, fischervolk pilots began to have undeniable impact on the Fokker Empire’s war effort, especially once fighting in Macchi reached the Caproni islands. The S4 was finally approved to equip these units, and by the end of the war frontline fischer units and a handful of other seaplane squadrons were using it.

The S4 was in every way an improvement over previous models. The Fokker Empire’s mastery of the cantilever spar was put to good use, allowing the plane to use a single long, aerodynamic wing for maximum lift. It was given a powerful V6 engine, twin guns, and all-plywood skin.

However, all was not well with the aircraft.

It was heavier than originally advertised, so after Fokker’s best seaplane ace removed one of his machine guns from the nose of his bright red plane, most new pilots followed suit, and soon they were produced that way in factories.

Of small note is the aircraft’s weapons are located in an open space that modern Circuses often use as cargo space or even a passenger spot.

The Rotes Schwein’s Own

One of a Kind. Anhedral parasol wing, engine to Brandt Krieger I, reliable gearing, additional fuel tank, power prop, +Lift Efficiency -Expense.

Common Variations

Fixed Forward Accessible MG ✂ Rotary Engine (+1 to Dogfight when turning Right)

Though the Ritter Model D Pfaue began life as a conventional land-based triplane, it did not stay that way for long. Originally, it was produced by Ritter for the United Western Federation as an iteration on the Model C, hopefully giving the flagging UWF Luftwaffe an edge against the larger Gotha Luftstreitkräfte. It was soon overshadowed by the more successful Model F and relegated to supplemental roles until the fall of the UWF.

In addition to still being common there, thousands were seized as trophies by the Fokker Kingdoms after the Macchi Republic fragmented into uprisings, guerrilla armies, and banditry. The survivors were sent to fisher villages to be used for training, and many remain there to this day.

However, when the Ritter factories evacuated to Macchi, the Republic found a new use for the Model D. Its stability made it a natural fit for their island garrisons, and the SeePfaue was born.

Common Variations

- Pfaue: Floats to landing gear.
- Upgunned: Second MMG.
- KW S-5: Fokker knockoff. Steel frame & struts.
- Night Fighter: Replace MMGs with twin wing LMGs.

Observation was considered a niche use for seaplanes during early Fokker campaigns. They were mostly seen as a means of maintaining scout coverage during the yearly flooding of the Doran Lowlands. Little thought was paid to the performance of two-seaters.

This changed as the war went north, especially once confronted with Macchi’s bizarre ‘Seeheer’ and its carriers, gunships, and u-boats. The Teicher Möwe I3S was designed in response with high endurance, forward and rear guns, robust steel construction, and a bombload. In theory, it could attack fleets far out to sea.

A good theory, but unfortunately, the engine it was supposed to have was earmarked for the von Morgen Vampyr. The Möwe was left underpowered and overweight, rotting as trainers in fisher villages. But it has potential...

Common Variations

- Wartime: Remove copilot controls, Rear/Up/Left/Right LMG Turret.
- Intended Powerplant: Replace engine with the Schrankhut RD.300V, add turret.
- I3L: Replace floats with wheels.
- I4S: Remove co-pilot & bombs. Long tail.

Toughness 8, Max Strain 23, Escape +3, Crash -1, Stress 3
x2 Flexible Forward/Up Accessible Wing LMGs Rotary Engine (+1 to Dogfight when turning Right)

Rotary engines require castor oil for lubrication, and the Macchi Republic produced more than 90% of the castor oil in Himmilgard. As relations with Gotha and Fokker worsened, this supply was cut off, forcing Macchi's enemies to turn to liquid-cooled engines and synthetic lubrication.

When Macchi was defeated, Gotha seized huge numbers of Ritter Model Fs, stripping out the engines to put them in their Kreuzer triplanes. They also seized the blueprints for the 230hp W.O.3 engine and were in the process of producing them for their next-generation fighters when the end of the world came.

If you were trapped in an industrial city in Gotha and you needed to make a plane to escape, you could do worse than attach one of those half-finished rotary engines to a cannibalized Model F airframe. There would be drawbacks, though: the engine is too large to fit the cowl, it'd need a heavy metal mounting frame, and would block the barrels of the machine-guns. But it could be done.

Known Variations

- Kreuzer Uncontrollable Spinne: Same principle, but with the body of a Kreuzer Spinne.
- Turbo Sparrow: Same principle, but with the body of a Ritter Model C and a W.O.I.

Toughness I6, Max Strain 2I, Escape +2, Crash -I, Stress I
Fixed Forward Accessible Gast Principle MG, Deflector Wedges (Wear on a <=5 on first Crit dice) Low Radiator

Castor oil has a shelf life: it only lasts a year. While fuel and synthetic oils in Himmilgard have stabilizing agents which have allowed stores of them to survive for decades, once castor oil goes off, it's no longer useable, which can be a problem if you need to use one of these planes to escape a bombed out city.

The Kreuzer Spinne was a solid design with an underpowered engine, so after the war in Macchi many were recalled to cities to have their engines replaced, where they remain. If lack of oil prevents reinstalling their original engines, one can improvise a conversion to liquid-cooled engines.

A few of these conversions, most mounting V8 engines taken from downed KW Adler-Ns, are seen every year, often armed with prototype gast guns taken from the conversion factories. Their performance is so impressive that some workshops have begun converting intact aircraft.

Common Variations

- Spider Six: Uses the Bertha F1466 Uber from the Kobra MD.
- Original Guns: Uses the original twin MMGs.

Fixed Forward Accessible MG ✘

Low Radiator, Armour 2/8+

Exactly who Hugo Bennhold was is a mystery. An aircraft designer prolific in the last years of the war, his nationality, education, and personal history are all unknown. It is speculated that he was a Junker in some small western principality, but even that is uncertain. What is known is that the man was absolutely obsessed with steel aircraft.

The All-Metal Wonderplane was the first of Hugo's designs, shipped by sky-line or zeppelin carriers to a number of large cities in a sort of advertisement scheme. The machine was sluggish, slow, and impractical, though technically impressive, and so they were usually left to moulder or put on display.

That said, many engineers took note of the wings, which stayed on without external means of support. These cantilever wings were soon copied by a variety of designers, though none of them were as robust as the Bennhold designs.

Common Variations

- Combat Ready: Upgrade to Bertha FI466 engine.
- Two-Seater: Add second position with xI rear/upward facing MMG, change tail to Stubby.
- Flying Tank: Narrow canopy, sealed engine cowl, and 2 more points of Armour 2.
- Folded 10,000 times: Add Wing Blades.

Forward/Up Access LRC Turret, Rear/Up Wing Access LMG, 5 Mass Bombs Wing Warping (+I to Dogfight! when below 15 Speed)

The L&L Kessel I served as a bomber and observer for the East Lohner People's Republic, and, after the annexation of the ELPR by the UWF, Salomon and Kurt Loeb were conscripted and encouraged to produce a successor.

The Kessel II was one of the first successful twin engined aircraft in the early years of the war, serving in the same roles, but by 1583 their speed and power advantages had been entirely surpassed and most were divested to local militias or for use as a civil utility aircraft, as its forward seat could be used by police watchmen, cartographers, touring celebrities, and so forth.

After the end the wide distribution of these aircraft and their ability to use nearly any powerplant made them popular as multiroles, especially since the unique tail structure and warping wings make them remarkably manoeuvrable for a bomber. Many were left in the dead cities, though the Scholz Luchs X IO-cylinder radial engines on the Kessel IIb are remarkably easy to restore to working order for anyone who might want one...

Common Variations

Many move LMG to pilot-operated forward mount.

- Kessel IIa: Rhona Motorbau Z12 engines.
- Kessel IIc: Bertha FII66 & low radiators.
- Funkvogel: No bombs, radio

In the lead-up to the Great War, trading anything but trinkets and garbage with Skyborn convoys was outright illegal in much of the world. This found many Skyborn convoys at their lowest point, making procuring aircraft quite nearly impossible.

The Skyborn and towns in Gotha soon developed a scheme: the towns would stage crashes, write off the engine, and sell the ‘scrap’ to the Skyborn. The government would replace the plane, the town would get paid, and the Skyborn could now build an aircraft. Their first designs resembled Arntwerke c-series the engines were taken from, but used traditional airship building techniques.

The Shamsher was the most common of these designs, protecting Skyborn convoys through the Great War with their pneumatic guns. Though obsolete, the Skyborn throw nothing away, and they have been adapted to carry rockets for use against pirate airships, grunder defences, and, sometimes, rival convoys.

Common Variations

Like other Skyborn planes, no two Shamshers are alike. The most common variation one might see out in the world is original configuration versions without the rocket hardpoints.

x2 Fixed Forward Accessible Pneumatic Scatterguns x2 Turret (Fore/Rear/Up/Left/Right) Accessible Pneumatic Scatterguns Rotary Engine (+1 to Dogfight when turning Left)

During the Great War, the Skyborn soon learned the value of sending scouts ahead of their convoys to avoid danger. These were usually armed airships, but these ships were not always fast enough to return with messages. Being a Sky Ranger, as they became known in Gotisch, was seen as nearly a suicide mission.

Building longer-range monoplanes to do the same task soon became a priority, and the Cheetal is the most common indigenous Skyborn design for these purposes. Though not the fastest or most agile, it is among the most heavily armed aircraft in the world for its size.

These planes are designed around a very rare engine, the near-mythical W.O 3 that powered the Ritter Model S. Skyborn ships were involved in salvage transport in Macchi at the end of the war, where examples and parts were acquired.

In addition to their uses as heavily armed outriders, convoys have begun hiring out the Cheetal Fighter as escorts for trade companies. Their pneumatic scatterguns are feared enough to deter any attack.

Common Variations

- Raid Rangers: Replace fixed scatterguns with bombload.

Low Radiator, Collimated Gunsight (+1 Attack)

The Königliche Sopwith Fliegerkorps developed a divergent combat philosophy from their mainland counterparts, believing that dogfighting and the "ace pilot" mentality was useless continental grandstanding that had no place in modern war.

Instead, the KSF used a tactic they referred to as the airborne gunline, and the Attentäter was designed for it from the ground up. Though neither as agile as most mainline fighters with its V8 engine, or as tough with its long, fragile wings, the Attentäter didn't need either. Fast in a straight line and controllable, it was designed to joust with enemy aircraft, and was exceedingly good at it.

The plane can carry as many as six machine-guns depending on its intended role. Its primary disadvantage is its violent stall characteristics, but KSF pilots were never expected to do much turning anyway.

Gun Configurations

Either set of LMGs can be removed or added before a mission for no cost.

Attentäter E

Sopwith still operates the Attentäter in their much-reduced military. Modern examples have SAM Kurier L 300hp engines and an extra fuel tank.

Dozens of small geo-states prior to the Great War had no aircraft industries of their own and had to buy aircraft from the Great Powers at extortionate prices. In addition to usually being obsolete surplus, these aircraft might not fit the mission profile required by their operators.

The small and mountainous Kingdom of South Loring was affected particularly badly. With all their population centres at least a kilometre above sea level, the Gotha and Macchi aircraft they could get weren't suitable. In the last years of the Great War, they studied these designs and built their own, complete with a two-stage supercharger.

The L.I is rarely seen, but those who've faced it know it is a deceptively deadly machine. Highly streamlined, its odd and upward-swept tail gives it a very distinct appearance, and it is far tougher than it looks due to thick wing spars and robust construction, and hidden under its cowl is a third machine gun firing through the spinner. A glass floor panel makes it easy to stalk prey from above.

While the Kingdom of South Loring no longer exists, there are several small republics in the region who use the machine exclusively. The heavily padded and reinforced cockpit is particularly valued, as it makes ditching the machine very safe.

The Vampyr was Fokker’s secret weapon in the coming war against the Gotha Empire. The Vampyr was stockpiled for the coming conflict, but due to the paranoia of the royal family, only a handful were deployed. Presumably, there are thousands of them sealed away in warehouses somewhere in the gassed-out cities of the former Fokker Kingdoms.

Those that have made it into the hands of pilots are frightening enough. They are often seen with cowls removed to make maintaining their overcompressed engines less of a hassle, as well as to impress onlookers.

von Morgen Vampyr 240

Legend says that on the eve of the end, a number of Vampyr 240s were fitted with special high-compression engines. These near mythical aircraft are said to be able to hang on the propeller in a stall climb, and the mere rumour of a Vampyr 240 can spark war between towns or Circuses. Those that claim to have one flaunt them by removing the cowl to show off the chrome finish.

A Vampyr 240’s regular engine is replaced by a Schrankhut RD.300V with an altitude throttle. It also adds a Speed propeller, prop gearing, an extra fuel tank, and open cowl. You cannot start with a 240, even if you can afford it.

The third of the commonly seen Bennhold designs, usually seen as having been developed alongside the similar, though much smaller "Hugo's Metallisches Jagdflugzeug!", this fighter saw some limited success in militias and smaller nations, but is undergoing something of a post-war renaissance.

Like all of Bennhold's designs, the One-of-a-Kind Steel Fighter-Bomber has no official designation, known only by its advertising blurb. Though perhaps less than a hundred were made before the war, their blueprints are widely available, so anyone with aluminium production can make one.

The machine is a great improvement over the first Bennhold design, with a more appropriate powerplant and a role that takes advantage of its robust construction.

The most common operators of these vehicles are shelter principalities, who often have the machine tools and materials to build them. Another prominent user is the aluminium-producing hydroelectric dam of Piav in the Fokker Mountains, operated by the communal militia.

Common Variations

- Original: No bombs. Internal bracing removed.

Flex Fore/Up Accessible Wing Light Repeating Cannon
High Radiator (Dumps water in face!)

The Theler Kobra MA was revolutionary when it first hit the field. Though heavy and sluggish even then, the fact it carried two synchronized machine guns put it miles ahead of the competition.

It wasn't without problems, though. Most notable was the bulky box radiator, which not only caused a lot of drag but tended to drain rapidly if damaged. The MA was swiftly replaced with the upgraded MB model, which moved the radiator to a panel in the upper wing to solve both problems.

Only issue was that if damaged, the radiator tended to dump boiling water in the pilot's face.

Though the problem was known, the MB stayed in production. Once the MC entered service, the MBs were pulled back to secondary duties. Balloon hunting with 20mm cannons was common, a hated job as you have to stand up to reload.

Stock Configuration

The Kobra can be returned to stock configuration by removing the cannon and adding 2 fixed forward accessible uncovered hull MMGs instead.

Common Variations

- MA: Replace radiator with Low Box radiator.
- Field Fix: Offset high radiator, Wing Cutout.

x2 Fixed Forward Accessible MGs ✂, Rotary Engine (+1 to Dogfight when turning Right)

With the end of the War in Macchi, the Gotha Empire seized both the powerful Ritter engines and the tooling to make more. But the question soon arose: what to do with the thousands of 110hp engines already produced?

They might have just rotted away, but Kreuzer proposed a lightweight, streamlined scout using the powerplant to supplement other forces, which would use parts commonality with the Spinne to keep costs down. The project was approved as the Skorpion, a para-monowing single-seater whose steel tube construction and birch cantilever made it faster than its aging engine should have allowed.

In the final build-up, the Skorpion was swiftly issued to regional defence squadrons across the continent. They never saw action properly, and so are often overlooked by combat pilots hunting for wartime staples. This means that a surprising number end up in the hands of the desperate, who don’t know enough to mistakenly dismiss it on the engine power alone.

Common Variations

- Ritter Engine: Schreiber B.IX engine.
- Racing Plane: Remove weapons.

The KW Adler-N, often simply known by its abbreviation to pilots, ended up serving as Fokker’s primarily scout for the back half of the Great War. It’s design reflected the Fokker Kingdom’s combat philosophy, with an emphasis on speed and technical sophistication.

The original KW-AA was intended to match the agility of the Ritter rotaries, but it failed miserably in combat trials, being easy prey for enemy Singvogels. Ultimately, however, it took a fairly minor modification to become competitive: the replacement of the four-bladed, direct drive propeller with a geared, two-bladed one.

Suddenly, the KW-AN could fight in the vertical with the same ease the Ritter planes fought in the turn, and it was back in the running. It would serve with distinction until the end of the war, upgraded with larger powerplants as the war wore on.

Common Variations

- KW-AA: Power prop. 2 Mass bombs. No gearing.
- Sniper Mode: Remove MMG. Replace LMG with Precision Rifle in the same mount.
- KW-SA: Change landing gear to floats.
- Late Model: Change cockpit to Narrow Canopy, upgrade powerplant to SAM Kurier XX.

Rear Gunner: Flex Up/Rear Access LMG. Belly Gunner: Flexible Down Access LMG

Among the grimmest of the Kingdom of Sopwith’s policies was the Volksfestung Program, where villages were given responsibility to maintain, train on, and if needed fly a heavy bomber. The industrial outlay involved was immense, each aircraft requiring enough engines and guns for two scouts. Some Volksfestungs were even rebuilt as ‘Dambrechers’, carrying a single 750kg bomb.

When the time came, these bombers had somewhere to come back to. Bombers, fewer each day, returned to the villages, loved ones snatching moments as they were refuelled and rearmed and taken aloft again. Eventually no bombers came back. The pilots and aircraft had scattered across the continent, preferring to risk the kindness of their victims to having to fly one more gas mission.

To build enough aircraft to equip a full bombing force and then hold them completely in reserve involved bankrupting the previously-rich Kingdom of Sopwith entirely and levying punitive taxes at all levels of society.

Common Variations

- Sky-Train Hunter: Remove bombload. Replaces forward machine-gun with a recoilless cannon.
- Q-Ship: No bomb bays. +1 LMG per Gunner.

Fixed Forward Accessible MG ✂, Rotary Engine (+1 to Dogfight when turning Right) Altitude Throttle (Can WEP at altitudes 0-10)

Before the war, the c.7 race plane was a fairly common sight, with many villages owning one to compete in racing leagues. They were one of the first aircraft ever to use ailerons instead of wing-warping, which was such a new technology that the later military versions reverted to the older control scheme due to reliability concerns.

After the war broke out, many rural villages retrofitted their c.7s with interrupter gears in the style of the c.10. They were better, one for one, than the c.10s used in the military. That said, they were also expensive custom aircraft, and for every militarized c.7 racer, there were a hundred c.10s.

These days, the c.7 is a common sight in the hands of rural militias and adventurers. They have the advantage of appearing like a generic c.10 until you get close, disguising their potential speed, and many of them have been upengined or otherwise improved. In some places, the old racing leagues have even started back up.

Common Variations

By this point, every racing plane is a unique beast, with a wide variety of unusual engines in use. A common factor is altitude throttles: nearly every racer goes out of their way to kludge in some sort of fuel additive injector for an extra boost.

Forward Accessible Scattergun Rotary Engine (+1 to Dogfight when turning Left)

As lead designer of Mitscher Industrie Gesellschaft, Johan Farmann was a great proponent of the central pusher engine to avoid shooting one’s own propeller. This handy little scout was a testbed for the idea, though it had bad teething problems and didn’t make field service until late 1582.

Displaying superb handling and a dismaying tendency to kill novice pilots, this machine was the great rival to the Arntwerke c.10 series. Though MIG produced a great number, thousands more were built under licence by Ritter, to the point where many believe they are a Ritter original.

After the war they have seen a second lease of life as cropdusters, the pusher propeller apparently aiding chemical dispersal. If you own one now, then the odds are good that this is not one of the ones with the manufacturing defect that causes cylinders to fly off the rotary engine and set fire to the aircraft. Not great odds, but good odds.

Common Variations

- Ritter Sperling A - License production
- J-79MG/ Sperling B - LMG instead of Scattergun
- J-79/83 - +1 Dihedral to both wings

Accessible Punt Gun Turret (Fore/Up/Down/Left/Right), 10 Mass bombs
Inline Radiator, Diesel Engine (Engine Won't Catch Fire)

A common civilian plane and likely to be the longest produced aircraft in the world, the Recht Air Tractor was designed from the ground up as an agricultural tool. With a heavy diesel engine, it can move surprising loads, making it adept as a transport, crop duster and topdressing, utility cargo mover, trade platform, and cloud seeding.

Though nobody would think of using this aircraft as a front-line combat machine, many have been pressed into this role over the years. Thanks to its surprising load capacity, it can carry a fair number of bombs a fair distance, so they were sometimes used in dangerous night bombing missions.

Nowadays, agricultural towns often count these machines among the forces their militia could potentially use, in an emergency, and a great many bush pilots got their start in ground attack by training to drop barrel bombs from an armed farm tractor.

Common Variations

Luftschleppers have been powered by every kind of engine under the sun over the years, as farmers retrofit it for whatever is on hand or appropriate for the job. Weapons, if present, are also highly variable.

Fixed Forward Accessible MG ✂, Collimated Gunsight (+1 Attack) Rotary Engine (+1 to Dogfight when turning Right)

Ritter's first interrupter-gearred scout, the Ritter Model C is remarkably easy to fly for a rotary-engine plane due to its long tail. This hurt manoeuvrability but Ritter considered it a worthwhile tradeoff to prevent the deadly spins and stalls so common in early air combat.

The aircraft was popular with crews and helped to build the UWF Luftwaffe into a corps of experienced pilots who were capable of handling more difficult designs. After the introduction of the Singvogel the Spatz was mostly moved to advanced training squadrons because of its similar characteristics.

Large numbers of Spatz of all variants survived the war and the same docile characteristics make it an ideal fighter for poorly-trained militia today. The fact it can be mistaken at a distance for the Model F or S helps, and some aircraft are deliberately painted with disruptive patterns to make the tail look shorter and the stance of the aircraft more aggressive to assist this deception.

Common Variations

- C Spatz: 80hp engine
- Cz Spatz: Twin overwing flex LMG, no MMG
- Ca Spatz: 2nd seat, copilot controls

Landing Skid (page 191)

The Gotha Empire celebrated its 200th anniversary with an unusual sight: a close formation of high-performance aircraft (for the era) flying in close formation above Kaisergrab. This was the start of a long and proud Gotha tradition of close stunt flying to celebrate the power and skill of the Empire’s airmen.

When the final war with Fokker broke out, many of these machines were redesigned into emergency bomber interceptors, using blades on their wings to cut apart incoming aircraft. This duty was considered quite nearly suicidal, and with discipline breaking down there were increasingly few pilots willing to risk it.

To celebrate the victory of Macchi, the stunt teams were issued the Theler Star, named for the flocking bird. These machines were not designed for combat, but instead as stable platforms for careful formations, with tandem wings and a rear propeller on an extended driveshaft.

Large numbers of these aircraft survived the war. Launched from outlying bases to defend cities which were often already lost, their pilots would simply fly away to rural areas and be marked as losses. Only the most foolhardy pilot would try to use these machines in their intended role.

Gunner: Accessible Fore/Up/Left/Right Turret Gast LMG, Telescopic Sight (+2 after Draw a Bead) Isolated (cannot leave seat, take double Injury when you Go Down), x2 Ammo

The MIG J-83 is the result of the absurd conditions of the war before the invention of the interrupter gear. The earlier AJ-80/82 wedged a gunner behind the pilot with a flexibly mounted machine gun, but found difficulty fighting effectively. A gun mount on the front of the aircraft was devised instead, using supports hung around the propeller for a basket containing a LMG and a brave gunner.

The aircraft's combat service was disastrous. UWF observers assigned to the plane had a combat life expectancy of three hours, compared to a pilot's forty eight hours. Most pilot losses were psychological casualties.

Today most J-83s are flown as single-seaters, using the basket for cargo hauling. Only the most suicidally brave observers would get in a J-83. But then, if you are the observer in a J-83 everyone knows you are suicidally brave, which has its benefits in bars.

Common Variations

- A-80: Remove Isolate, remove LMG.
- AJ-80/82: Remove Isolate, gun to Rear/Up.
- Strengthened: Add Padding and roll cage.
- Waffentrager: Replace the turret with a fixed no interference Heavy Cannon.

Wing Warping (+I to Dogfight when <I5 Speed)

8 Mass Bombs

x2 Turret Access LMG (One Fore/Up/Right, one Fore/Up/Left)

The Arntwerke d.I3 was a design any other company would call a failure. Using only components from the c.5 series of observers, the aircraft was intended to act as a heavy fighter with two gun positions that could fire uninterrupted by propellers. Unfortunately, the use of wing warping controls and the two independent tails meant that when the aircraft was rolled the tails deflected in different directions.

This led to what the first test pilot to return described as “very divergent flight characteristics”, but Arntwerke was already tooled to make the d.I3 and orders for thousands had been made.

It was found that if the aircraft was handled with sufficient care it made a decent straffer, and was agile enough to tangle with interceptors. But by that point most had been dispersed to secretarian paramilitaries who were considered stupid and expendable enough to be entrusted with it.

Common Variations

The main priority of most wise pilots who find themselves having to fly a d.I3 is to add flap ailerons as soon as possible. Less wise pilots try to replace the tiny Schreiber L.VII engines with something bigger, or add larger guns to the pods, including fixed guns to use as a fighter.

Combat in the early years of the war showed the complete superiority of any aircraft that could fire directly forwards. Rathenau’s first type, the 7, used a deflector plate but this was obviously a stopgap and Meike Kessler, Rathenau’s chief designer, drew up a clean sheet aircraft in 1582.

The resulting Rathenau-9 was Macchi’s primary fighter aircraft, at least until the Ritter company moved their factories there in 1587. It provided good handling but was infamous for breaking up in dives. The Rathenau-II mostly fixed this issue and added another machine gun in an attempt to keep up with the Kobra types coming into service.

As Ritter planes became more common, Rathenau planes soon found a new niche in balloon-hunting squadrons, using rockets to down observers before they could be winched out of danger.

The early model 9b and 9c variants are extremely common and put up a fair fight, and their secondary balloon-busting capabilities are greatly valued by pirates and the less reputable sort of circus.

Common Variations

- 9b: 80hp engine, speed prop, 3 microtanks
- 9d: 130hp engine
- IIa: 9d, replace LMG with Fixed Fore Hull MMG, change optimization from -Support to -Expense
- IIb: IIa with Fixed Fore Wing LMG

There are very few new aircraft being invented, and fewer built as any more than one offs. But the demand is there, and aeronautics instructor Professor Ludwig Gernsback is a prominent name in that market.

Dr. Gernsback believes that another conflict for the soul of Himmilgard is imminent, likely against the forces of the Goth Armies, and has been working tirelessly for ten years to develop a machine that will give an advantage against them. He believes the future lies in smooth airframes, pressurized cockpits, and the power of the heat ray, and designs his machines to match.

His grad students work tirelessly to assemble, test, and rebuild his increasingly large stable of experimental aircraft, often distributing them to other universities for testing. It isn't entirely clear if the numbers are serial numbers or production runs, but they are rare either way.

Common Variations

- 0011: Wings have Extreme Positive Stagger

In a great many engineering institutions, a final test for prospective aircraft designers is to actually design and build an aeroplane, usually in conjunction with local artisan guilds training craftsmen. Many of these designs are fairly safe, but some are unique and a few groundbreaking.

But Vera Mauss of the University of Steinfurth has the dubious honour of making the most well known and influential. Attempting to impress her notoriously demanding professor, she delivered a machine that attempted to reinvent every aspect of aircraft design. The resultant machine flew for fifteen minutes before flipping and crashing hard.

Vera’s teachers began using the machine in their lessons as ‘The Counter-example’, an illustration of everything you aren’t supposed to do.

Unfortunately, every year there’s a joker who tries to make it work anyway, and so many of them have piled up in the workshop that the University has started selling them off, often at such bargain prices that even starving students can potentially afford them. The fact they are likely to kill their operators in a flat spin is often left out.

Vera Mauss went on to design the Mauss X-65, often seen as the best fighter of the post-war era.

The Kobra series, since it is so well known and well studied, is a common platform for experimental fits and Final Year Projects, the last make-or-break test of the engineering student. The idea of tandem annular wings has rather captured the imagination of the aerodynamics community in the last few years and many students have attempted investigations of the possible benefits.

So many of these aircraft have been built and studied that they are becoming something of a baseline in themselves, and some have received subsequent experimental conversions to create scouts that have little in common with their origins.

The Kobra-series are already known as extremely stable designs, but these tandem wing designs tend to be so stable that they are legitimately hard to fly, wanting to straighten out like an arrow. The generally accepted spin recovery procedure for these aircraft is to let go of the controls.

Common Variations

- Well Funded: Aluminium Skin wings.
- Lucky: Bertha F1466 Über Engine.
- Forward Thinking: Add 2 Microtanks.

The "Fast Mammoth" is one of the most famous Mammut variations, the result of an alliance between engineers at the University of Heidelberg and a team of reserve bomber pilots in the immediate post-war period. The bombers were trying to stop a rampaging Leviathan, but couldn't outrun its automated escort planes.

The solution of replacing the regular engines with four large pulsejets did allow the bombers to complete their mission, but wasn't without downsides. The range reduction and frustration from constantly replacing broken shutters were bad, but far worse was the experience of flying it.

The noise, vibration, and heat has been described as being locked in a blast furnace during an earthquake. This rendered the machine useless as a cargo carrier or long range bomber, but deadly as a shorter ranged attack craft.

While it can't necessarily outrun all interceptors in a straight-line fight, its speed makes safely intercepting much more difficult. The heat rays added help considerably.

Common Variations

- Schneller: Remove top turrets & batteries.
- Schnellest: also +Streamline, -Leg Room.

Rotary Engine (+I to Dogfight when turning Right)

The late 1580s and early 1590s were a time in scout aircraft design known as the Lift Wars, where experience in the war was teaching designers that the most vital thing for fighter aircraft was high lift. This led to many aircraft with three or more wings, of which the Rathenau-I6 was a runner-up.

Though developed in parallel to the Ritter Model D, the Rathenau-I6's development was interrupted by the fall of the UWF, and the resulting machine was released years later. Its unusual wing configuration was supposed to give the benefits of a sesquiplane design and a triplane, though the machine is ultimately too stable.

Probably the single greatest advantage the machine has is the reinforced weapon mount above the wing, added at the last minute to try and give the plane more utility.

Weapon Loadouts

All alternate weapon loadouts replace the upper wing gun.

Many of the small nations, principalities, and free cities of Himmilgard were at various times incapable of securing orders of warplanes from the major nations, making alliances and armed neutrality difficult. A roaring trade in knockoff designs soon followed, with the most popular being the Braun Model D, derived from the Theler Kobra series and often considered superior.

Of these, the DC is the odd one out. Unlike the others in its series, it is equipped with a remarkable engine: A large 'Contrarotary', where the engine spins one way while the propeller and crankshaft spin the other, reducing torque.

Furthermore, the machine was equipped with a large, four-bladed propeller, which gave it a frightening ability to recoup lost speed. The result was a machine that, while not fast, could hold a sharp turn at a fixed speed quite nearly indefinitely, and even gain speed while in combat turns using its unique double-throated carburettor.

Ersatz Model DCs

Sometimes, other marks of the Model D, or even Theler Kobras, are adapted into ersatz Model DCs by switching in a rotary engine and a High Power propeller. They are of dubious utility.

x2 Fixed Forward Accessible MGs ✂, Telescopic Gunsight (+2 to Attack when Drawing a Bead) 2 Mass Bombs, Rotary (+I to Dogfight when turning Right), Oxygen Mask, Alternator

The last Ritter rotary, the Model S consumed nearly half a decade of the designer's life in perfecting it. A redesign of the Model F, improved in every way, the Model S carries the frightening W.O.3 230 horsepower engine. Both wings had to be given dihedral angles to compensate for the immense torque.

The Fink had aggressive turn characteristics, robust construction, and could outrun anything that could outturn it. Though they never completely replaced the Model F, it was soon known and feared by its enemies, and it was the last, best chance for the doomed Macchi Republic.

Though rare, many dogfight aces consider them to be the best rotary biplanes in the world. Few survived, most of them cut apart for the engines after Macchi surrendered, so each one is treasured.

Model TF 'Elster'

The Fink was hyper-specialized for its role and employed for a relatively short time, and so few official variations exist. The most common is an armoured ground attack variation, used in the final sieges of the war to destroy guns and panzers.

To make a Model TF, add x6 Thickness 2 armour, and double the ammunition for the main guns.

Strategic bombing went from mere speculative theory to integral strategy of air warfare. Of the many vehicles used for this task, the Theler Eklipse was by far the most widespread, going through a large number of modifications over its service life.

Starting with the ZC model, the Eklipse gained a gun tunnel, a slot in the tail that gave the gunner increased visibility as well as allowing them to cover the area under the tail, traditionally where bombers are most vulnerable.

Originally, the Eklipse was developed to bomb the field outposts used to anchor UWF Air Destroyers in rural areas of Lohner, which were a constant thorn in the side of attacking forces. Their wild success in this role lead to them supplementing bombing airships in attacking cities, industrial towns, and army bases, and soon they were being upgraded and widely produced.

Common Variations

- ZB: Bertha F1466s, rear gun can't fire down.
- ZC: Bertha F1466 Übers, forward gunner replaces machine gun with 20mm cannon.
- ZE-I: 5 IAF superchargers on the engines.
- ZF: Bertha F2080 Über engines.

Johan Farmann’s final full design for MIG before his untimely death testing weapons mounts for the JA-83 fighter, the JA-8I essentially resembles an upscaled J-79.

Intended for use as a fighter-observer, the aircraft was forced to resort to an inline engine rather than Farmann’s preferred rotary due to stability issues, resulting in disappointing handling. However, the type was sturdy enough to stand up for itself in a fight and the gunner could gain an excellent field of fire by standing on their nacelle backwards and firing the pilot’s machine gun astern meaning that a series of bomber variants were produced as well.

Ritter, flush with success from the Sperleng, also licensed the JA-8I but only built a few hundred before focusing on Scout production.

Common Variations

- Ritter Kolkrabe - License Production. Removes the flexible gun, leaving just the gun post.
- Z-8I - Gunner replaced by 10 Mass internal bomb bay, +dive brake, remove 1 LMG
- JA-8I/83 - Flexible gun replaced with fixed forward accessible LMG for the pilot.
- JA-8I/87 - Wollsteinkraft Verteidiger C, +1 External Wing Tank.

Likely the single most common aeroplane in the entire world, the c.10 is a modification of an unarmed civilian craft, the c.8, equipped with a single gun and an interrupter gear. Thus, the first armed scout that was safe, reliable, and effective.

The c.10 was Gotha’s standard scout, and there were many imitators. They were pulled from front-line service by the mid-1580s, but they were so inexpensive that they continued production as a militia plane. They may still be being made, given that Goth armies seem to have an almost unlimited supply of them, and desperate Circuses sometimes find themselves forced to fly them.

Variations

The c.10 went through many engines: the earliest used 80hp Rhona ZIIs. Modern Goth examples often use copies of the 130hp Schreiber B.IX.

c.II Ace

A small number of c.10s were fitted with 170hp Rhona ZZ22 engines, a double-rowed ZII (21.8 Litre displacement, 18 cylinders in 2 rows) and attachment of two additional machine-guns. A small number were produced and issued to ace pilots and volunteers, but the huge torque made it nearly unmanageable. Planes were often given angled wings or new control surfaces to cope.

Inline Radiator, 2 Mass Bombs (Internal, Max Size 2)

SAM was an engine manufacturer in Eisenfluss, a Free City in Daimler, building the popular Kurier V8 series for other nations. As the war came to Daimler, they began producing custom aircraft for the Free Cities Alliance as well.

The SAM 99 represented the ultimate evolution of their scouts. It has many clever innovations, including a high speed propeller, internal bomb bay, and razor-thin multibay wings. The weight of the aircraft and staid, careful aerodynamics rendered it a poor turning fighter, but the geared engine allowed it to outclimb, outdive or outrun nearly anything else in the air.

It is often said that a disciplined SAM 99 pilot is almost invincible, but a reckless SAM 99 pilot will ruin a beautiful aircraft as they die.

SAM.99 Motorkanone

Many SAM aircraft, including early SAM.99s, did not use machine guns. Instead, a 37mm cannon (HC) was mounted between the engine cylinders, firing through the propeller spinner. The breach protruded into the cockpit to allow reloading.

Though most replaced it with machine guns, some models instead mounted 20mm cannons in the same motorkanone configuration.

Pilot: x1 Fixed Forward Accessible MG ✂, Collimated Gunsight (+1 Attack), Quality 4 Bombsight Gunner: x2 Rear/Left/Right/Up Access Turret LMGs. Inline Radiator, 10 Mass Bombs

The SAM II44 used their massive SAM Transporter 300hp engine and was a conventional-looking light bomber, observer and auxiliary fighter. It is widely considered one of the best two-seaters in the world, with price being the primary drawback.

The austere styling of the II44 again hides some impressive features, including a duralumin frame and passively-operated flaps. Its closest equivalent is perhaps the Markgraf Zerstörer, but while the Zerstörer is a better fighter, the II44 concentrates on carrying a bomb load approaching a true bomber while retaining enough speed to challenge most scouts.

The toughness of the II44 is legendary all on its own. Despite lacking cantilevers, the cross-braced wings and steel construction mean aircraft have returned from missions with considerable structural damage, including missing pieces of wing or shattered spars.

The most common complaint about the II44 is one shared with most SAM designs, visibility. The exhaust pipe, often referred to as ‘The Smokestack’, sits dead in the pilot’s vision for some reason.

Common Variations

- II44-Sturzbomber: Replace flaps w/ dive brake.

The Teicher Mammut is famous as the first four-engine aircraft, but post-war it is often considered underwhelming due to the low power of its engines. The majority were restored to passengers and cargo carriers after the UWF fell, and those still in combat use are drastically modified.

If you are a cargo driver, however, the Mammut has much to recommend it. The glass cockpit is comfortable to fly from for long journeys, the machine is easily reconfigured for goods or passengers, and the low powered engines are fairly easy to maintain. It's a very practical machine, if not a very powerful one.

Most Mammutts have one or two defensive turrets on the roof: The gunners climb up from the cabin to operate a pivoting gun on a stand to hopefully deter any opportunistic attackers. Wholly exposed, this position is popularly known as The Stake (*Der Pfahl*), a reference to the poles firing squad victims would be tied to for wartime executions.

Common Variations

- Transport: Large cargo bay or 10 passengers.
- One Stake: Remove second gunner position, remaining one fires forward.
- Free Cities Albatrosbomber: Engines to SAM Transporter 1s, +4 fuel tanks.

Teicher Mammut are among the most common cargo aircraft in the world now, as many were built by the UWF but few deployed in action. They are often further customized by their owners, sometimes to fairly staggering degrees.

This machine likely would have been used for moving medicine, narcotics, and people who wanted to evade interception. Smuggler vehicles like this were once a common sight in Himmilgard, a testament to the lawlessness of the era.

This example is a rather impressive demonstration of this trend, designed to move small quantities of goods through unfriendly skies. Among the main modifications is aftermarket overcompression and supercharging on all engines, cut down wings for extra agility and speed, and the addition of two enclosed gun turrets, each carrying four 11mm interlinked machine guns for defence.

Using the Smuggler

This isn't a vehicle to simply be sold to Circuses, but instead can be used as part of a campaign. Having to catch it before it escapes would be a good challenge for a small group, as would be stealing it and flying to a client through dangerous skies. Alternately, a whole group could operate one together.

Plane Builder Link

Braun YA Post Runner

17b New, 8b Used

"Precious Lifelines"

1b Upkeep

Undoubtedly the most common sort of aircraft in the skies of Himmilgard are post runners, a ragtag mixture of disarmed obsolete fighters and purpose-built mail planes like this one.

Speeds	Handling	Structure
23 - 15 - 12 - 8	90	2I
I Crew. 2 Engines. Low radiator. Small cargo space. 20 Fuel Uses.		

Markgraf Pegasus

19b New, 9b Used

"The People-Mover"

2b Upkeep

With the end of the war, Markgraf returned to building public transit equipment, and as part of that transition, half-finished Zerstörer fighters were converted to fast short-hop airliners.

Speeds	Handling	Structure
28 - 18 - 16 - 5	90	37
I Pilot, 5 Passengers. Inline radiator. 7 Fuel Uses.		

Recht Universal Transport

27b New, 13b Used

"Long Haul Transport"

3b Upkeep

Logistics in Himmilgard is nightmarish at the best of times, with airships as the primary arm of transport. Small cargo planes like these often handle the final leg of these journeys.

Speeds	Handling	Structure
28 - 17 - 13 - 11	84	50
I Pilot, x2 Engines, High Radiator, 15 Fuel Uses Large Cargo Space, Altitude Autopilot, Diesel Engine (Won't Catch Fire)		

Hugo's Halbmetall-Schwertransport!

113b New, 56b Used

"The Pioneer"

7b Upkeep

The Fokker Kingdoms were only able to maintain their war effort and holdings in the far north because of a robust system of transports, like these von Morgen copies of a Hugo design.

Speeds	Handling	Structure
26 - 16 - 12 - 10	65	100
3 V12 Engines, Low Radiator, 13 Fuel Uses 2 Pilots, 5 Passengers, Huge Cargo Space		

Skyborn Dhow

20p New, 10p Used

"The Family Business"

0p Upkeep

Skyborn convoys consist of a mix of small family ships like this, with crews of less than twenty, which can make short trips to small villages without risking the main convoy.

Max Speed	Lift	Handling	Toughness
IdIO + 3	55	90	20
Hydrogen. 4-12 crew. Large Cargo Space. x2 LMG posts. Randomize top speed each flight, add Wind penalty to speed.			

Skyborn Windjammer

40p New, 20p Used

"The Last Sailing Airships"

0p Upkeep

The use of whalebone keels allows the Skyborn to use fast sailing airships, minimizing their costs and maximizing the profits of trade missions.

Max Speed	Lift	Handling	Toughness
IdIO + 5	55	75	35
Hydrogen. 25-40 crew. Huge Cargo Space. x6 LMG or LRC posts. Randomize top speed each flight, add Wind penalty to speed.			

K-class Air Corvette

"The Border Watchmen"

The UWF's fleet of compact battle airships was their greatest asset in the early war with Gotha. K-Class corvettes were the last of these, known for their heavy spotlight turrets.

Max Speed	Lift	Handling	Toughness
16	60	80	30
Hydrogen. 20-45 crew. x8 engines. Carries 2 small fighters. x6 twin MG turrets, forward Flak Cannon			

Jörmungandr-class Air Destroyer

"Ship of the Line"

The most common form of Air Destroyer in the war, forming the basis of the Gotha Empire's zeppelin fleet. A warlord repairing a downed Jörmungandr can threaten an entire region.

Max Speed	Lift	Handling	Toughness
12	60	40	100
Luftane. 100-250 crew. x6 Engines. Armoured Skin 2, Armour 4/5+. x8 Flak Cannons. Large number of machine gun turrets. Pushes Weather Flak against attackers.
